

## Bracket information / Pricing / How we build our brackets

Epic Marine has listened to our clients. Most are restoring a boat or adding a bracket for better handling/room and fuel economy. All of our brackets use 5052 marine grade Aluminum and are welded not only on the outside but inside at critical seams and stress points. We also from time to time add additional structure in our brackets for certain motors and uses. Additionally we add 5" tall by ¼" thick channel where the engines will be mounted, this gives a total of ½" thick Aluminum for the motor mounting. Our brackets are also built to order and we start off with a basic price for a un powder coated bracket with no swim platform and go from there. Customers can add as they like from our list of options. Most customers that are restoring a boat will be painting it so ordering the bracket bare Aluminum they can color match to the boat while painting the hull. We recommend this being that there are so many shades of colors for powder coat and the likely hood of a perfect match are low.

We do offer powder coating as well as non skid application in our options list. Painting the bracket and the customer spraying or rolling their own non skid texture is a great option to save money and also achieve a color match and exact texture each individual client is looking for. Our company strives to provide a great bracket at a great price while also allowing the customer to save money on labor by doing some of the work themselves. We have found there is no "One bracket fits all" in the marine industry. We will work with you on price/options/fitment and installation guidance. We also welcome customers to come to our facility and pick up your bracket or stop in for a consult on options and what will work for your boat and situation.

We look forward to you becoming a Epic Marine client.
